

Window Interfaces Using Swing

Chapter 12

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Introduction

- Modern programs don't simply read text input from the keyboard and write text output to the screen.
- Modern programs use window interfaces with buttons and menus, and allow users to make choices using a mouse.
- We will learn how to write simple window interfaces using the Swing library.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Introduction, cont.

- We'll also use an older library known as AWT (Abstract Windows Toolkit) which is a necessary complement to the Swing library.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

GUIs - Graphical User Interfaces

- Windowing systems that interact with users often are called *GUIs*.
- A GUI accepts information from a user and makes it available to the program for processing.
- Most of the interaction is graphical in nature.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Definitions

- A *window* is a portion of the user's screen - a screen within a screen.
 - Typically, it has a border and a title.
- A *menu* is a list of alternatives available to the user.
 - A menu item is selected by using the mouse to place the cursor over the selected item, and by clicking the mouse.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Definitions, cont.

- A *button* serves much the same purpose as a menu item.
 - Typically, a button has a label.
 - The button is pushed by using the mouse to position the cursor over the button, and by clicking the mouse.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Event-Driven Programming

- Most GUI program use events and event handlers.
- A GUI *event* is an object that represents some action such as clicking a mouse, dragging a mouse, pressing a keyboard key, clicking the close-window button on a window, etc.
- When an object generates an event, it is said to *fire* the event.

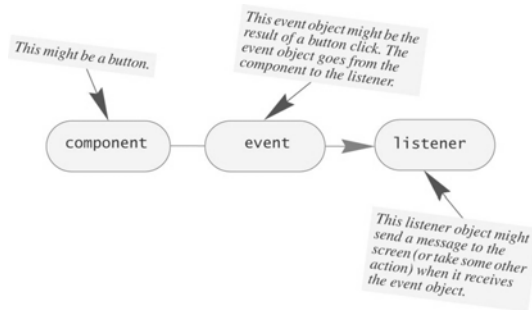

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Event-Driven Programming, cont.

- Objects that can fire events have one or more *listener* objects.
- The programmer chooses which event-firing objects have listeners.
- *Event handlers* are programmer-defined methods associated with the listener objects that determine what happens when events are detected by their associated listener(s).

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Event-Driven Programming, cont.

Display 12.1
Event Firing and an Event Listener

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Characteristics of Event-Driven Programming

- Our previous programs consisted of a list of statements to be executed in some order.
- In event-driven programming, events caused by user actions determine the upper-level order of activities.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Characteristics of Event-Driven Programming, cont.

- Each of us finds himself (or herself) in event-driven mode at one time or another.
 - We might be reading the newspaper waiting for the news to start.
 - But, if the phone rings, we answer it (or at least look at the caller ID).
 - If the doorbell rings, we answer it (or at least go to the door to see who is there).

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Characteristics of Event-Driven Programming, cont.

- If the news starts, we focus our attention on the TV.
- If someone brings home pizza, we go to the kitchen to get a slice of pizza.
- If the phone rings again, we answer the phone (or look once again at the caller ID).
- etc.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Characteristics of Event-Driven Programming, cont.

- In general, it's impossible to predict this sequence of events in advance.
- When we write a GUI, there may be several methods that we never call directly.
- Instead, Swing calls these methods for us in response to events which have *listeners*.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Characteristics of Event-Driven Programming, cont.

- The classes that we define will be derived from classes in the Swing library.
- Sometimes we'll use inherited methods, and sometimes we'll override them.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Basic Swing Details

- We'll start with window elements to
 - close the window
 - put text in the window
 - color the window
 - put a title on the window.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Caution

- Sometimes, when running a Swing program, it becomes necessary to reboot the computer; any files that were left open may be damaged.
- Before running any Swing program that is not fully debugged, we should close all open files.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Example: A Simple Window

- This simple program produces a window and displays some text.
- If the close-window button is clicked, the program ends and the window disappears.
- The program is just a simple demo and it is not using the typical Swing style.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Example: A Simple Window, cont.

```
import javax.swing.*;

public class FirstSwingDemo
{
    public static final int WIDTH = 300;
    public static final int HEIGHT = 200;

    public static void main(String[] args)
    {
        JFrame myWindow = new JFrame( );
        myWindow.setSize(WIDTH, HEIGHT);
        JLabel myLabel =
            new JLabel("Please don't click
that button!");
        myWindow.getContentPane( ).add(myLabel);

        ... cont.
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Example: A Simple Window, cont.

... cont.

```
WindowDestroyer myListener = new
    WindowDestroyer( );
myWindow.addWindowListener(myListener);

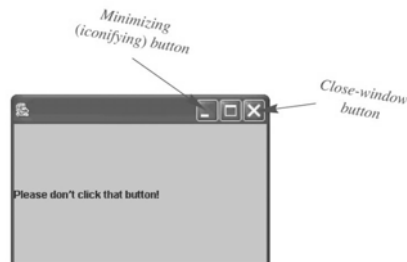

myWindow.setVisible(true);
}
```

- Note: the class `WindowDestroyer` does not belong to Swing, we have to code it

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Programming Example: A Simple Window, cont.

Resulting GUI

Display 12.2

A Very Simple Swing Demonstration Program

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Size Units for Screen Objects

- The size of an object on the screen is measured in pixels.
- A *pixel* is the smallest unit of screen space onto which you can write.
- Pixels do not represent fixed lengths, but depend instead on the size and resolution of the screen.
- The exact size of what is produced varies from screen to screen.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

More on setVisible

- Method `setVisible` takes one argument of type `boolean`.
- Example

```
w.setVisible(true);
```
- Method `setVisible` permits the programmer to specify when GUI objects should be displayed and when they should not.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Window Listeners

- A *window listener* listens to events from a window, such as a click on the close-window button.
- A window listener is *registered* when it becomes associated with the object(s) (i.e., calling `addWindowListener`) to which it listens.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Class `WindowDestroyer`

- A listener class often is derived from class `WindowAdapter`.
- The inherited methods respond automatically to different kinds of events.
- The way an event is handled depends on the programmer.
- Typically, an inherited method definition is overridden.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Class WindowDestroyer, cont.

```
import java.awt.*;
import java.awt.event.*;

/* Registering an object of this class as a listener to
   any object of the class JFrame, then if the user
   clicks the close-window button in the JFrame, the
   object of this class will end the program and close
   the JFrame.*/

public class WindowDestroyer extends WindowAdapter
{
    public void windowClosing(WindowEvent e)
    {
        System.exit(0);
    }
}
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Ending a Swing Program

- A GUI program is based on a kind of infinite loop.
- The windowing system normally stays on the screen until the user indicates that it should go away.
- The `exit` method ends a Java program as soon as the `exit` method is executed.

```
System.exit(0);
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Ending a Swing Program, cont.

- If the window-close button is not programmed (i.e. `windowClosing`), a click causes the window to disappear, but does not cause the program to end.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Methods of Class WindowAdapter

```
public void windowOpened(WindowEvent e)
```

Invoked when a window has been opened.

```
public void windowClosing(WindowEvent e)
```

Invoked when a window is in the process of being closed. Clicking the close-window button causes an invocation of this method.

```
public void windowClosed(WindowEvent e)
```

Invoked when a window has been closed.

```
public void windowIconified(WindowEvent e)
```

Invoked when a window is iconified. When you click the minimize button in a `JFrame`, the window is iconified. See Display 12.2 for the location of the minimizing (iconifying) button.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Methods of Class WindowAdapter, cont.

```
public void windowDeiconified(WindowEvent e)
```

Invoked when a window is deiconified. When you activate a minimized window, it is deiconified.

```
public void windowActivated(WindowEvent e)
```

Invoked when a window is activated. When you click in a window, it becomes the activated window. Other actions can also activate a window.

```
public void windowDeactivated(WindowEvent e)
```

Invoked when a window is deactivated. When any window is activated, all other windows are deactivated. Other actions can also deactivate a window.

```
public void windowGainedFocus(WindowEvent e)
```

Invoked when a window gains focus. (Focus is not discussed in this text.)

```
public void windowLostFocus(WindowEvent e)
```

Invoked when a window loses focus. (Focus is not discussed in this text.)

```
public void windowStateChanged(WindowEvent e)
```

Invoked when a window changes state.

JAVA:

by Walter Savitch.

ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Methods of Class WindowAdapter, cont.

- Because class `WindowAdapter` is abstract, this class can be used only as a base class for defining other classes.
- When you define a derived class of abstract class `WindowAdapter`, you override and redefine only those methods that you need.

JAVA: *An Introduction to Problem Solving & Programming*, Fourth Edition by Walter Savitch.

ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Programming Example: Improved Swing Program

- This program presents two windows rather than just one.
- Further, this program demonstrates an appropriate style for writing GUIs.
 - The definition of the window is in a separate class, derived from class `JFrame`.
 - The window is displayed in a program that uses the class.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Improved Swing Program, cont.

```
import javax.swing.*;

public class FirstWindow extends JFrame {
    public static final int WIDTH = 300;
    public static final int HEIGHT = 200;
    public FirstWindow( ){
        super( );
        setSize(WIDTH, HEIGHT);
        JLabel myLabel = new JLabel("Please don't
click that button!");
        getContentPane( ).add(myLabel);
        WindowDestroyer listener = new
                                WindowDestroyer( );
        addWindowListener(listener);
    }
}
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Improved Swing Program, cont.

```
import javax.swing.*;

public class FirstWindowDemo
{
    public static void main(String[] args)
    {
        FirstWindow window1 = new FirstWindow( );
        window1.setVisible(true);

        FirstWindow window2 = new FirstWindow( );
        window2.setVisible(true);
    }
}
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Improved Swing Program, cont.

Resulting GUI

If it looks as though you have only one window when you run this program, move the window. The windows may be one on top of the other.

Display 12.7

A Program That uses the Class FirstWindow

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Adding Items to a JFrame

- Inside a constructor a `JLabel` can be added to a `JFrame` using

```
getContentPane().add(JLabel_Name);
```

- Note: don't use the method `add` directly!!

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Programming Example: A Window with Color

- We add four new features:
 - a title
 - a background color
 - a local variable named `contentPane`
 - a new way to add the window listener

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Example: A Window with Color

```
import javax.swing.*;
import java.awt.*; //needed for the Color class
public class SecondWindow extends JFrame{
    public static final int WIDTH = 200;
    public static final int HEIGHT = 200;
    public SecondWindow( ){
        super( );
        setSize(WIDTH, HEIGHT);
        Container contentPane = getContentPane( );
        JLabel label = new JLabel("Now available in
color!");
        contentPane.add(label);
        setTitle("Second Window");
        contentPane.setBackground(Color.BLUE);
        addWindowListener(new WindowDestroyer( ));
    } cont.
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Example: A Window with Color – cont.

```
public SecondWindow(Color customColor)
{
    super( );
    setSize(WIDTH, HEIGHT);

    Container contentPane = getContentPane( );
    JLabel label = new JLabel("Now available in
color!");
    contentPane.add(label);

    setTitle("Second Window");
    contentPane.setBackground(customColor);

    addWindowListener(new WindowDestroyer( ));
}
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Example: A Window with Color – cont.

```
import java.awt.*; //for the class Color
public class SecondWindowDemo
{
    /*
     Creates and displays two windows
     of the class SecondWindow.
     */
    public static void main(String[] args)
    {
        SecondWindow window1 = new SecondWindow( );
        window1.setVisible(true);

        SecondWindow window2 = new
                               SecondWindow(Color.PINK);
        window2.setVisible(true);
    }
}
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Programming Example: A Window with Color, cont.

Resulting GUI

Display 12.10

A Demonstration Program for SecondWindow

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

The Color Constants

<code>Color.BLACK</code>	<code>Color.MAGENTA</code>
<code>Color.BLUE</code>	<code>Color.ORANGE</code>
<code>Color.CYAN</code>	<code>Color.PINK</code>
<code>Color.DARK_GRAY</code>	<code>Color.RED</code>
<code>Color.GRAY</code>	<code>Color.WHITE</code>
<code>Color.GREEN</code>	<code>Color.YELLOW</code>
<code>Color.LIGHT_GRAY</code>	

The class `Color` is in the AWT package (library). So when using these colors, you need the following `import` statement:

```
import java.awt.*;
```

Display 12.9
The Color Constants

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Anonymous Objects

- Some methods (`addWindowListener`, for example) need objects as arguments, even when no subsequent reference to such objects is needed.
- Such an object can be created and passed without naming it. Example

```
addWindowListener( new  
WindowDestroyer( ) );
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Some Methods of Class JFrame

Method	Description
<code>JFrame()</code>	Constructor for creating a new JFrame.
<code>JFrame(String title)</code>	Constructor for creating a new JFrame with the specified title.
<code>add</code>	JFrame has a method <code>add</code> , but it should not be used. (It is basically a useless inheritance from an ancestor class). To add something to a JFrame, use <code>getContentPane().add(Item_Added)</code>
<code>void addWindowListener(WindowListener ear)</code>	Registers ear as a listener for events fired by the JFrame.
<code>Container getContentPane()</code>	Returns the content-pane object of the JFrame. Note that the content pane that is returned is of type Container.
<code>void setBackground(Color c)</code>	Sets the background color to c.
<code>void setForeground(Color c)</code>	Sets the foreground color to c.
<code>void setSize(int width, int height)</code>	Resizes the window to the specified width and height.
<code>void setTitle(String title)</code>	Displays the title on the title bar of the window.
<code>void setVisible(boolean b)</code>	Makes the window visible if the argument is true. Makes it invisible if the argument is false.

Display 12.11

Some Methods in the Class JFrame

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Some Methods of Class JFrame, cont.

- A window class normally is derived from class JFrame.
- A derived window class inherits all the methods (described on the previous slide(s)) from class JFrame.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

What to Import

- It may be simpler to use

```
import javax.swing.*;  
import java.awt.*;  
import java.awt.event.*;
```

rather than trying to determine which import statements are needed for a particular window interface.

- `event.*` represents a package within `java.awt.`

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Layout Managers

- The objects that you add to a container class are arranged by an object known as a *layout manager*.
- A layout manager is added using method `setLayout`, which is a method of every container class.
- syntax

```
Container_Object.setLayout(new  
    Layout_Manager_Class(Any_Parameters));
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Border Layout

- Border layout can be used to arrange three items vertically instead of horizontally.
- class BorderLayoutDemo

```
import javax.swing.*;
import java.awt.*;

/**
 * Simple demonstration of the use of a layout manager
 * to arrange labels.
 */
public class BorderLayoutDemo extends JFrame
{
    public static final int WIDTH = 300;
    public static final int HEIGHT = 200;

    /**
     * Creates and displays a window of the class BorderLayoutDemo.
     */
    public static void main(String[] args)
    {
        BorderLayoutDemo gui = new BorderLayoutDemo();
        gui.setVisible(true);
    }
}

public BorderLayoutDemo()
{
    setSize(WIDTH, HEIGHT);
    addWindowListener(new WindowDestroyer());
    setTitle("Layout Demonstration");
    Container content = getContentPane();
    content.setLayout(new BorderLayout());
    JLabel label1 = new JLabel("First label here.");
    content.add(label1, BorderLayout.NORTH);
    JLabel label2 = new JLabel("Second label there.");
    content.add(label2, BorderLayout.SOUTH);
    JLabel label3 = new JLabel("Third label anywhere.");
    content.add(label3, BorderLayout.CENTER);
}

Display 12.12
Using the Border Layout Manager
```

Border Layout, cont.

Resulting GUI

Display 12.12

Using the BorderLayout Manager

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Border Layout, cont.

- A BorderLayout manager can place a component into any of five regions.
- Regions which are unused give up their space to BorderLayout.CENTER.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Border Layout, cont.

- equivalent forms:

```
content.add(label3,  
            BorderLayout.CENTER);
```

and

```
content.add(label3, "Center");
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Flow Layout

- The simplest layout manager is the `FlowLayout` manager.
- Components are added and arranged one after another, left to right, until a row is filled. Then components are added to the next row in the same manner.
- Each row is centered in its container.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Grid Layout

- A `GridLayout` manager arranges components in a grid of rows and columns.
- Example

```
aContainer.setLayout(new  
    GridLayout(2,3));
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Grid Layout, cont.

- Each entry has the same size.
- Rows are filled one at a time, top to bottom, and from left to right within each row.
- Even though the number of columns is specified, the actual number of columns is determined by the number of items added to the container.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Some Layout Managers

Layout Manager	Description
FlowLayout	Displays components from left to right in the same fashion that you normally write things on a piece of paper.
BorderLayout	Displays the components in five areas: north, south, east, west, and center. You specify which area a component goes into in a second argument of the <code>add</code> method.
GridLayout	Lays components out in a grid, with each component stretched to fill its box in the grid.

Display 12.13

Some Layout Managers

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Default Layout Managers

- When a default manager is not added explicitly, a default layout manager is provided.
- The default manager for the content pane of a `JFrame` is `BorderLayout`.
- The default manager for a `JPanel` is `FlowLayout`.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Buttons

- A *button* is a GUI component that looks like a button and does something when it is clicked using a mouse.
- Like a label, a button is created and added to a container.
- Unlike a label, a button can fire an event and the event can cause a GUI to perform some action.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Adding Buttons

- A button is created using
`JButton Button_Name = new
JButton("Button_Label");`
- A button is added to a container using
`Container_Name.add(Button_Name);`

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Adding Buttons, cont.

- class ButtonDemo

```
import javax.swing.*;
import java.awt.*;
import java.awt.event.*;

/**
 * Simple demonstration of putting buttons in a JFrame.
 */
public class ButtonDemo extends JFrame implements ActionListener
{
    public static final int WIDTH = 300;
    public static final int HEIGHT = 200;

    /**
     * Creates and displays a window of the class ButtonDemo.
     */
    public static void main(String[] args)
    {
        ButtonDemo buttonGui = new ButtonDemo();
        buttonGui.setVisible(true);
    }

    public ButtonDemo()
    {
        setSize(WIDTH, HEIGHT);
        addWindowListener(new WindowDestroyer());
        setTitle("Button Demo");
        Container contentPane = getContentPane();
        contentPane.setBackground(Color.BLUE);

        contentPane.setLayout(new FlowLayout());
        JButton stopButton = new JButton("Red");
        stopButton.addActionListener(this);
        contentPane.add(stopButton);
        JButton goButton = new JButton("Green");
        goButton.addActionListener(this);
        contentPane.add(goButton);

        public void actionPerformed(ActionEvent e)
        {
            Container contentPane = getContentPane();
            if (e.getActionCommand().equals("Red"))
                contentPane.setBackground(Color.RED);
            else if (e.getActionCommand().equals("Green"))
                contentPane.setBackground(Color.GREEN);
            else
                System.out.println("Error in button interface.");
        }
    }
}
```

It will take more than one subsection to fully explain this program. The explanation does not end until the end of the subsection entitled "Action Listeners and Action Events."

A GUI with Buttons Added

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Close-Window Buttons and `JButtons`

- A button added to a GUI is an object of class `JButton`.
- A close-window button is not an object of class `JButton`. Instead, it is part of a `JFrame` object.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Action Listeners and Action Events

- For each button, the GUI needs to
 - register (specify) the listener object(s).
 - define the methods to be invoked when an event is fired.
- For a statement such as
`stopButton.addActionListener(this);`
the class `ButtonDemo` is itself the listener class.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Action Listeners and Action Events, cont.

- Different kinds of components require different kinds of listener classes.
- Buttons fire ***action events*** which are handled by *action listeners*.
- An action listener is an object of type `ActionListener`, and `ActionListener` is an *interface*.
- Any class can be an `ActionListener` class...

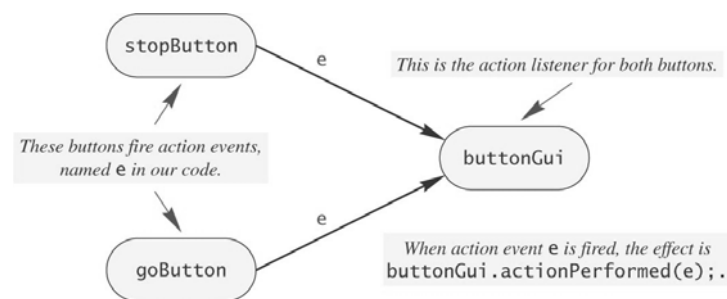

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Action Listeners and Action Events, cont.

- To make a class into an `ActionListener`
 - add `implements ActionListener` to the heading of the class definition
 - define a method named `ActionPerformed`.
 - register the `ActionListener` object with the component that will fire the event using the method `addActionListener`
 - (A component may register with more than one listener.)

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Buttons and an Action Listener

Display 12.15

Buttons and an Action Listener

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

The actionPerformed Method

- An `ActionListener` class must have a method named `actionPerformed` that has one parameter of type `ActionEvent`.

- syntax

```
public void actionPerformed(ActionEvent e)
{
    Code_for_Actions_Performed
}
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Interfaces

- An *interface* is a property of a class that states what methods the class must define.
- `ActionListener` is an interface.
- A class which satisfies the requirements of an interface *implements the interface*.
- A class can define methods in addition to the methods required by the interface.
- An interface is not a class, but it is a type.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Interfaces, cont.

- To implement an interface, a class must
 - include the phrase `implements Interface_Name` at the start of the class definition
 - implement all the method headings listed in the definition of the interface.
- A programmer can define his own interfaces.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Multiple Interfaces

- A class which implements multiple interfaces lists the names of all the interfaces, separated by commas.

```
implements First_Interface_Name,  
           Second_Interface_Name, ...,  
           Last_Interface_Name
```
- The class must implement all the methods of all the listed interfaces.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Code a GUIs Appearance and Actions Separately

- Code for a Swing GUI is simpler if it is divided into two parts:
 - the GUI's appearance on the screen
 - the GUI's actions.
- In a complicated Swing GUI, either of these tasks by itself can be formidable.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Method `setActionCommand`

- We can think of the method invocation `e.getActionCommand()` as returning the string written on the button.
- In fact, this method invocation returns a string known as the *action command* for the button.
- A different action command can be specified for the button using the `setActionCommand`

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Method `setActionCommand`, cont.

- example

```
JButton stopButton =  
    new JButton("Red");  
stopButton.setActionCommand("Stop");
```

- This permits the same string to be written on two different buttons, but with the two buttons distinguished from one another by the program.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Method `setActionCommand`, cont.

- Every object that fires an action event has an associated string known as the *action command* for that component.
- `e.getActionCommand()` returns the action command for the component that fired `e`.
- The default action command for a button is the string written on it.
- Method `setActionCommand` can be used to change the action command for the object.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

The JPanel Class

- A GUI can be organized hierarchically, with window-like containers inside other window-like containers.
- Class `JPanel` is a simple container that does little more than hold components.
- Components can be placed in a `JPanel` which can be placed in another `JPanel`, ... which can be placed in a `JFrame` (better, in its `ContentPane`).

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

The JPanel Class, cont.

- To place two components (e.g., 2 buttons) in `BorderLayout.SOUTH` for example, simply place the two components in a panel and place the panel in the `BorderLayout.SOUTH` position.
- The panel has its own layout manager.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

The JPanel Class, cont.

```
import javax.swing.*;
import java.awt.*;
import java.awt.event.*;

/**
 * Simple demonstration of putting buttons in a panel.
 */
public class PanelDemo extends JFrame implements ActionListener
{
    public static final int WIDTH = 300;
    public static final int HEIGHT = 200;

    public static void main(String[] args)
    {
        PanelDemo guiWithPanel = new PanelDemo();
        guiWithPanel.setVisible(true);
    }

    public PanelDemo()
    {
        setSize(WIDTH, HEIGHT);
        addWindowListener(new WindowDestroyer());
        setTitle("Panel Demonstration");
        Container contentPane = getContentPane();
        contentPane.setBackground(Color.BLUE);
        contentPane.setLayout(new BorderLayout());

        JPanel buttonPanel = new JPanel();
        buttonPanel.setBackground(Color.WHITE);

        buttonPanel.setLayout(new FlowLayout());

        JButton stopButton = new JButton("Red");
        stopButton.setBackground(Color.RED);
        stopButton.addActionListener(this);
        buttonPanel.add(stopButton);

        JButton goButton = new JButton("Green");
        goButton.setBackground(Color.GREEN);
        goButton.addActionListener(this);
        buttonPanel.add(goButton);

        contentPane.add(buttonPanel, BorderLayout.SOUTH);
    }

    public void actionPerformed(ActionEvent e)
    {
        Container contentPane = getContentPane();
        if (e.getActionCommand().equals("Red"))
            contentPane.setBackground(Color.RED);
        else if (e.getActionCommand().equals("Green"))
            contentPane.setBackground(Color.GREEN);
        else
            System.out.println("Error in button interface.");
    }
}
```

The Container Class, cont.

- The hierarchy of Swing classes (vedere libro di testo pag. 879)

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Abstract Classes

- An *abstract class* is a placeholder in a hierarchy typically and is used to consolidate characteristics of all of its descendants.
- You cannot instantiate objects of an abstract class directly.
- An abstract class can serve as the base class for derived classes which can be instantiated.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

The Container Class

- Class `Container` is a predefined class.
- An object of a class which descends from class `Container` is called a *container class* and can have components added to it.
- Class `JFrame` is a descendent of class `Container`, permitting any `JFrame` object to hold labels, buttons, panels, and other components.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

The Container Class, cont.

- Class `JPanel` is a descendent of class `Container`, permitting any `JPanel` object to hold labels, buttons, other panels, and other components.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

The JComponent Class

- Class `JComponent` is similar to class `Container`, and plays a similar role for components.
- Any class that descends from `JComponent` is called a `JComponent` class.
- Any `JComponent` object can be added to any `Container` object.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

The JComponent Class, cont.

- Since class `JComponent` descends from class `Container`, a `JComponent` object can be added to another `JComponent` object.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Adding Components

- To add a component to a `JFrame`, use method `getContentPane` to obtain the content pane, and then use method `add` with the content pane as the calling object.

- example

```
Container contentPane = getContentPane();  
JLabel label = new JLabel("Click Here");  
contentPane.add(label);
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Adding Components, cont.

- For other container classes, add components by using method `add` directly with an object of the container class.

- example

```
JPanel buttonPanel = new JPanel();  
JButton stopButton =  
    new JButton("Stop");  
buttonPanel.add(stopButton);
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Objects in Swing Containers

- Swing containers use three kinds of objects:
 - the container class itself (such as a panel)
 - the components (labels, buttons, panels, etc.)
 - the layout manager.
- Typically, a GUI interface, and many subparts of the GUI, will consist of these three kinds of objects.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Creating Simple Window Interfaces: Guidelines

- A typical GUI consists of a windowing object derived from class `JFrame`, together with components such as labels and buttons.
- The programmer must register a window listener to close the window.
- Components are grouped by placing them in a `JPanel` and by adding the `JPanel` to the GUI.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Creating Simple Window Interfaces: Guidelines, cont.

- The GUI (i.e. the `JFrame`) and each `JPanel` should be given a layout manager.
- The GUI (or some other class) needs to be made an action listener, by implementing `ActionListener`, for components which generate events of interest.
- Each such component should have an action listener registered with it, and an appropriate `actionPerformed` method defined.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.

A GUI with a Text Area

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Text Areas and Text Fields, cont.

- Method `getText` returns the text written in an object of class `JTextArea`.
- Method `setText` of class `JTextArea` changes the text in the text area into whatever is provided as the argument to method `setText`.
- Class `JTextField` is similar to class `JTextArea`, but displays only one line of text.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Text Areas and Text Fields, cont.

- Classes `JTextArea` and `TextField` have a constructor with no arguments; it sets the parameters to default values.
- Both classes can have some text specified when `new` is used to create an object.
- example

```
TextField IOField =  
    new TextField("Aloha!", 20);
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Text Areas and Text Fields, cont.

- An object of class `JTextArea` can have a size consisting of a specified number of lines and a specified number of characters per line.
- example

```
JTextArea someText =  
    new JTextArea(10,30);
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Text Areas and Text Fields, cont.

- An object of class `JTextField` can have a size consisting of a specified number of characters.

- example

```
JTextField name =  
    new JTextField(10);
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Text Areas and Text Fields, cont.

- The number of characters (per line) is not absolute, but represents the space needed for one 'm' character.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Line Wrapping in Text Areas

- Method `setLineWrap` sets the line wrapping policy for a `JTextArea` object.
- example

```
theText.setLineWrap(true);
```
- If the argument is set to `false`, extra characters will be on the same line, but will not be visible.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Read-Only Text Components

- To specify that a user cannot write in a `JTextArea` or a `JTextField`, use method `setEditable`.
- example

```
theText.setEditable(false);
```
- A `JTextArea` or a `JTextField` can be made editable subsequently using, for example

```
theText.setEditable(true);
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Programming Example: Labeling a Text Field

- Typically, a label precedes a text field to tell the user what information is needed in the text field.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.

Labelling a Text Field

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Inputting and Outputting Numbers

- Input provided using a `JTextArea` object or `TextField` object is received as a string.
- When numeric input is needed, the string must be converted to a number.
- To output a number using a GUI constructed with Swing, the number must be converted to a string.
- All input typed by the user is string input, and all displayed output is string output.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Inputting and Outputting Numbers, cont.

- To convert a string to an integer, use, for example

```
Integer.parseInt("42");
```

or

```
Integer.parseInt(ioField.getText());
```

or, to eliminate whitespace before or after the input, use

```
Integer.parseInt  
    (ioField.getText().trim());
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Inputting and Outputting Numbers, cont.

- To input numbers of type double, use

```
Double.parseDouble(ioField.getText().trim());
```

- Analogous conversions can be done with classes `Long` and `Float`.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Inputting and Outputting Numbers, cont.

- Code can be made simpler by defining a method such as

```
private static int stringToInt(String s)
{
    return Integer.parseInt(s.trim());
}
```

and then using

```
n = stringToInt(ioField.getText());
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Inputting and Outputting Numbers, cont.

- To write numeric output to a `JTextArea` or a `TextField`, use method `toString`.

- examples

```
Integer.toString(sum);
Double.toString(average);
ioField.setText(Integer.toString(sum));
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.

A GUI Adding Machine

```
import javax.swing.*;
import java.awt.*;
import java.awt.event.*;

/**
 * GUI for totaling a series of numbers.
 */
public class Adder extends JFrame implements ActionListener

    JPanel buttonPanel = new JPanel();
    buttonPanel.setBackground(Color.GRAY);
    buttonPanel.setLayout(new FlowLayout());
    JButton addButton = new JButton("Add");
    addButton.addActionListener(this);
    buttonPanel.add(addButton);
    JButton resetButton = new JButton("Reset");
    resetButton.addActionListener(this);
    buttonPanel.add(resetButton);
    contentPane.add(buttonPanel, BorderLayout.SOUTH);

    JPanel textPanel = new JPanel();
    textPanel.setBackground(Color.BLUE);
    textPanel.setLayout(new FlowLayout());

    inputOutputField = new JTextField("Numbers go here.", 30);
    inputOutputField.setBackground(Color.WHITE);
    textPanel.add(inputOutputField);
    contentPane.add(textPanel, BorderLayout.CENTER);

    public static final int WIDTH = 400;
    public static final int HEIGHT = 200;
    private JTextField inputOutputField;
    private double sum = 0;

    public static void main(String[] args)
    {
        Adder guiAdder = new Adder();
        guiAdder.setVisible(true);
    }

    public Adder()
    {
        setTitle("Adding Machine");
        addWindowListener(new WindowDestroyer());
        setSize(WIDTH, HEIGHT);
        Container contentPane = getContentPane();
        contentPane.setLayout(new BorderLayout());

        Display 12.21
        An Addition GUI
    }
```

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.

A GUI Adding Machine, cont.

```
public void actionPerformed(ActionEvent e)
{
    if (e.getActionCommand().equals("Add"))
    {
        sum = sum +
            stringToDouble(inputOutputField.getText());
        inputOutputField.setText(Double.toString(sum));
    }
    else if (e.getActionCommand().equals("Reset"))
    {
        sum = 0;
        inputOutputField.setText("0.0");
    }
    else
        inputOutputField.setText("Error in adder code.");
}

private static double stringToDouble(String stringObject)
{
    return Double.parseDouble(stringObject.trim());
}
```

Catching a `NumberFormatException`

- A GUI, such as class `Adder`, has no control over what the user enters in the text field. The user might enter commas, or even alphabetic characters, resulting in a `NumberFormatException`, which leaves the GUI in an unpredictable state.

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Catching a NumberFormatException, cont.

- A `NumberFormatException` can be caught, and the user can be asked to reenter the number.

*JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.*

Catching a NumberFormatException, cont.

```
import javax.swing.*;
import java.awt.*;
import java.awt.event.*;

/**
 * GUI for totaling a series of numbers. If the user
 * enters a number in an incorrect format, such as
 * 2,000 with a comma, then an error message is generated
 * and the user can restart the computation.
 */
public class ImprovedAdder extends JFrame
    implements ActionListener
{
    public static final int WIDTH = 400;
    public static final int HEIGHT = 200;
    private JTextField inputOutputField;
    private double sum = 0;

    public static void main(String[] args)
    {
        ImprovedAdder guiAdder = new ImprovedAdder();
        guiAdder.setVisible(true);
    }

    public ImprovedAdder()
    {
        <The rest of the definition is the same as the constructor
        Adder in Display 12.21.>
    }

    public void actionPerformed(ActionEvent e)
    {
        try
        {
            tryingCorrectNumberFormats(e);
        }
        catch (NumberFormatException e2)
        {
            inputOutputField.setText("Error: Reenter Number.");
        }
    }
}
```

This class is identical to the class Adder in Display 12.21, except that the name of the class is changed and the method actionPerformed is changed.

```
//This method can throw a NumberFormatException.
public void tryingCorrectNumberFormats(ActionEvent e)
{
    if (e.getActionCommand().equals("Add"))
    {
        sum = sum +
            stringToDouble(inputOutputField.getText());
        inputOutputField.setText(Double.toString(sum));
    }
    else if (e.getActionCommand().equals("Reset"))
    {
        sum = 0;
        inputOutputField.setText("0.0");
    }
    else
        inputOutputField.setText("Error in adder code.");
}

//This method can throw a NumberFormatException.
private static double stringToDouble(String stringObject)
{
    return Double.parseDouble(stringObject.trim());
}
```

Display 12.22
A GUI with Exception Handling

ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.*

Catching a NumberFormatException, cont.

Resulting GUI

As long as the user enters correctly formatted numbers, this GUI behaves exactly the same as the one in Display 12.21.

If the user enters a number in an incorrect format, such as a number with a comma, the GUI looks like this.

Display 12.22

A GUI with Exception Handling

JAVA: An Introduction to Problem Solving & Programming, Fourth Edition by Walter Savitch.
ISBN 013149020. © 2005 Pearson Education, Inc., Upper Saddle River, NJ. All rights reserved.

Summary

- You have learned the basics of event-driven programming.
- You have designed and coded a simple GUI with buttons and text.
- You have learned about several Swing-related classes.
